Content

This dataset includes descriptions of hypothetical samples corresponding to 23 species of gilled mushrooms in the Agaricus and Lepiota Family Mushroom drawn from The Audubon Society Field Guide to North American Mushrooms (1981). Each species is identified as definitely edible, definitely poisonous, or of unknown edibility and not recommended. This latter class was combined with the poisonous one. The Guide clearly states that there is no simple rule for determining the edibility of a mushroom.

Inspiration

What types of machine learning models perform best on this dataset?

Our Work Procedure:

If we just read and give the data to the classifiers and run our experiments then the result comes is not satisfactory. So we shuffled the data just after reading it from the file. Then we divided the data according to its class properly. Then we ran our test on different classifiers and the results are mentioned below.
